

IDS, a global provider of customised software solutions for the upstream oil and gas industry, has been awarded the contract by Noble Corporation to deliver the next generation of reporting capabilities to its entire global fleet. With a 'Go-Live' date of March 1st, 2013, IDS successfully delivered to Noble Corporation a rig-centric service called TourNet Pro. This web-based application was specifically designed to meet the operational reporting needs of the global drilling contractor.

Noble Corporation sought out to find an innovative and efficient alternative to their reporting system in order to streamline operations and gain valuable commercial intelligence. Until now, the mandatory IADC report and the required operational reports had been handled in separate processes, meaning the data was not easily used for monitoring KPIs and other crucial deliverables. Noble chose IDS, through an extensive definition and selection process where TourNet Pro came out the front-runner as a web-based system that would centralise the data and allow it to be easily mined for operational knowledge.

IDS developed TourNet Pro to provide Noble with a rig-tailored application that allows captured data to be used continuously, while ensuring that data only needs to be entered once. This continuity enhances operations and IADC reporting as well as ensures that the drilling contractor can obtain up-to-date and, where required, up-to-the-minute information pertaining to their fleet. The results can be presented at the touch of a button via on-demand dashboards, as well as exported to any traditional business document format.

IDS

For over fifteen years, IDS has been providing customised solutions for the upstream oil and gas industry. With the remarkable DataNet2 suite of web-based software modules, IDS bridges the gap between data and knowledge in operational activities. Whether it is through daily drilling and geological reporting, graphical data analysis and dashboard-delivered KPIs, or the tracking of inventory daily costs, IDS provides software solutions that are completely tailored to the business of upstream data management.

With a client base of operators, rig-owners, and service companies spanning the globe, IDS elevates the standards of innovation, while continuing to provide exceptional service through our 24/7 global customer support team. Your operational data is safe and secure with IDS; residing in our world-class data centres. All the information you need is fully indexed and always just a click away.
